

LIKHAHAHOY WOODCRAFTS

Group Daderob

Description

The project focuses on designing and developing a **Woodcraft Business Database** that will store, organize, and manage essential business data. This includes product details, customer information, orders, and sales records. The database aims to improve data organization, ensure accuracy, and make information easily accessible for future system development. It serves as the foundation for a potential business management system.

Key Functionalities

- Store and manage product information (woodcraft items)
- Record customer details
- Track orders and sales transactions
- Update and delete records when needed
- Search and retrieve data efficiently
- Maintain data consistency and organization

Stakeholders

- **Business Owner** – Uses data for monitoring sales and inventory
- **Staff/Encoder** – Inputs and updates data in the database
- **Customers** – Source of order and transaction data
- **Database Developer (Project Team)** – Designs and manages the database
- **Instructor** – Evaluates the database design and implementation

Core Data Process

1. **Input** – Data such as products, customers, and orders are entered into the database
2. **Processing** – The database organizes and validates the data relationships
3. **Storage** – Data is stored in structured tables (e.g., products, customers, orders)
4. **Retrieval** – Users can search and access stored data when needed
5. **Update/Delete** – Records can be modified or removed to maintain accuracy
